| <b>14. ABSTRACT</b><br><br>Many hydrophobic surfaces exist in nature, but there is no naturally occurring oleophobic surface. There is plenty of academic and commercial interest in the development of oleophobic surfaces. The focus is on commercially available textiles. This presentation shows that fluoroPOSS are superhydrophobic. FluoroPOSS polymer composite surfaces can be superhydrophobic and superoleophobic. Superhydrophilic and superoleophobic surfaces have been developed. Such surfaces are ideal for the separation of both free-oil and oil-water emulsions. These membranes, for the first time, allow continuous-flow oil-water emulsion separation. Functionality will allow the covalent attachment of these low energy materials to substrates of choice. |                                    |  |  |  |   |

[www.tressugar.com](http://www.tressugar.com)

# Non-wetting surfaces

Contact angles with water:

Superhydrophilic

$$\theta \sim 0^\circ$$

Hydrophilic

$$0^\circ < \theta < 90^\circ$$

Hydrophobic

$$\theta > 90^\circ$$

Superhydrophobic

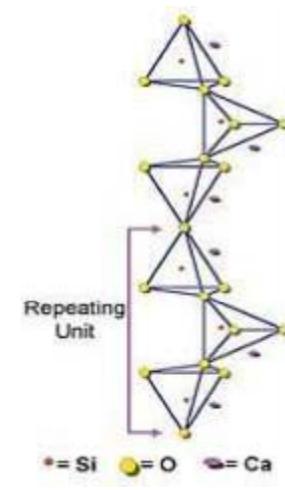

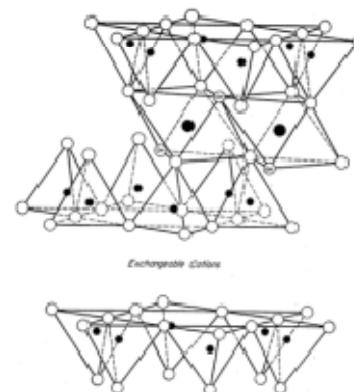

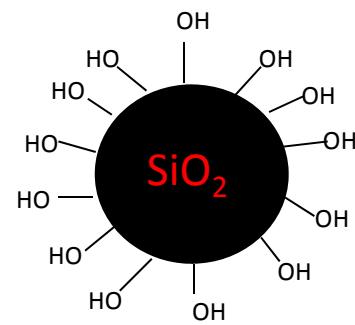

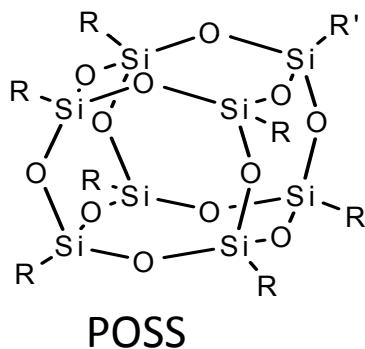

$$\theta^* > 150^\circ$$

Similarly, superoleophobic surfaces display contact angle  $\theta^* > 150^\circ$  with oils or alkanes

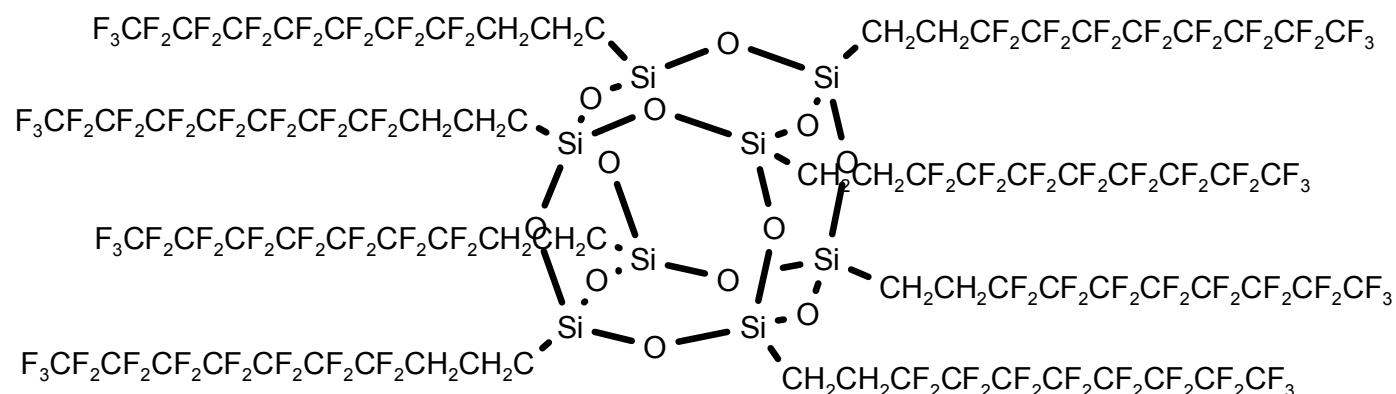

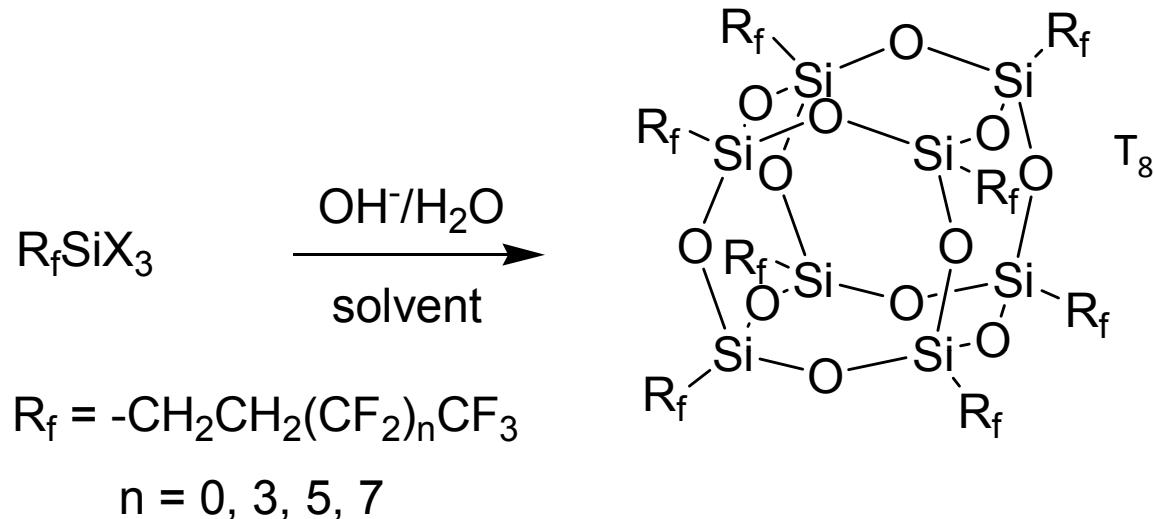

# Nanocomposite Materials

## Silicon-containing compounds

# Fluorinated POSS Synthesis

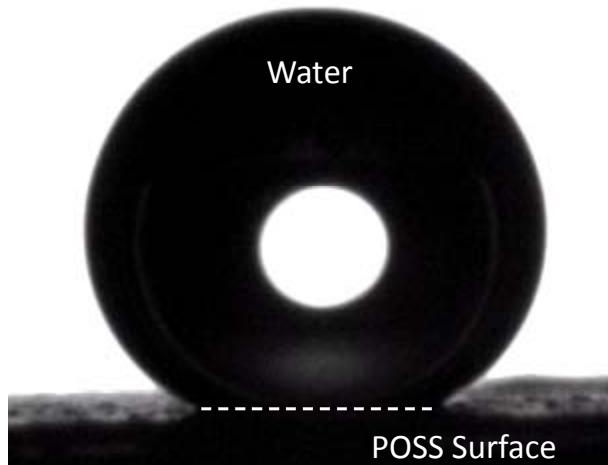

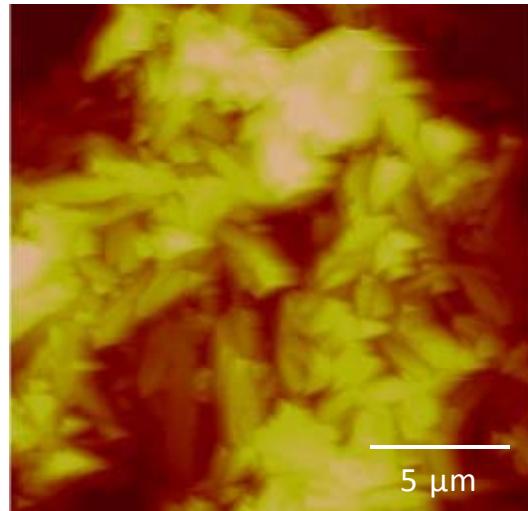

Angew Chem (2008)

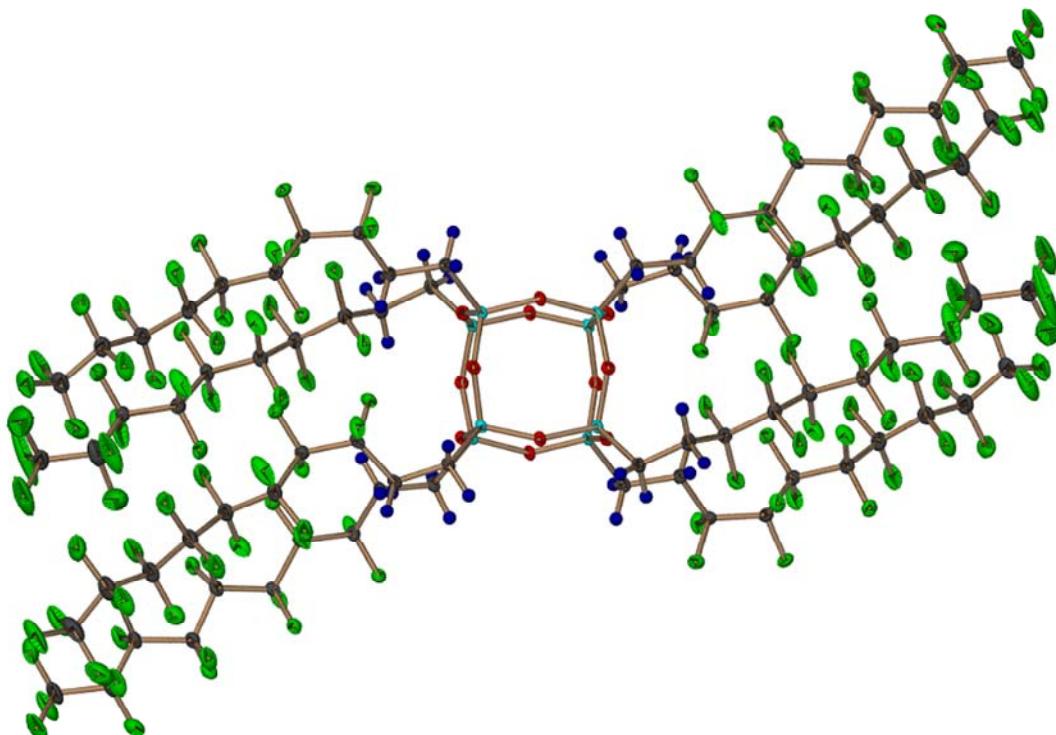

*DISTRIBUTION A. Approved for public release; distribution unlimited.*

# Hydrophobic Materials

- Spin-cast surface of Fluorodecyl POSS
- ~4 μm rms roughness by AFM
- 154° Water contact angle

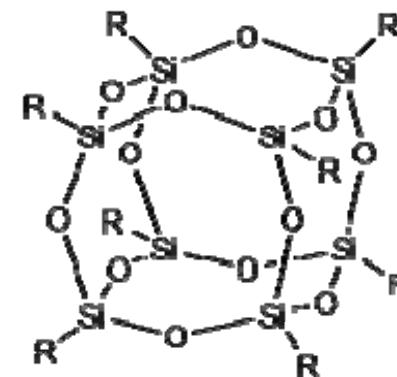

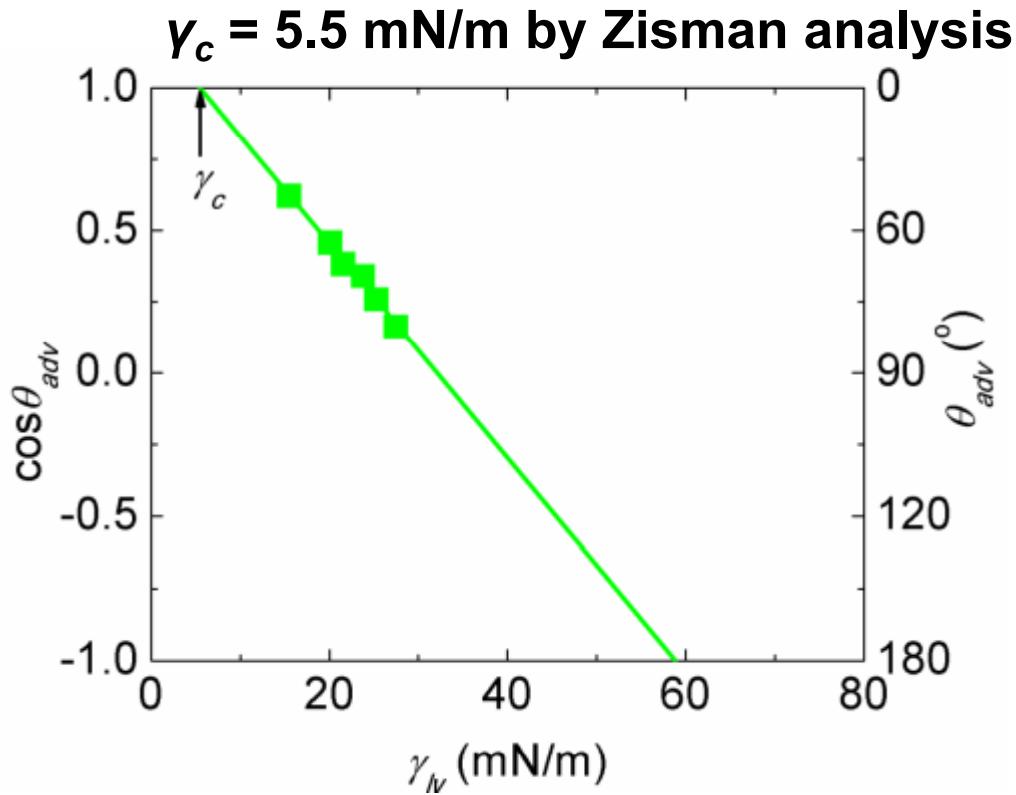

*Angew Chem (2008)*

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Low Surface Energy Materials

Fluorodecyl:  
 $R = -\text{CH}_2\text{CH}_2(\text{CF}_2)_7\text{CF}_3$

Similarly, GG analysis results in surface energy calculation of:  $\gamma_c = 8 \text{ mN/m}$

## Contacting liquids:

hexadecane ( $\gamma_{lv} = 27.5 \text{ mN/m}$ ), dodecane (25.3), decane (23.8), octane (21.6), heptane (20.1), and pentane (15.5)

ACS AMI (2010)

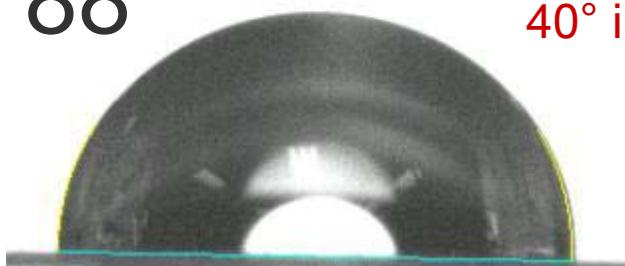

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Water/Oil Repellant Nanocomposites

88°

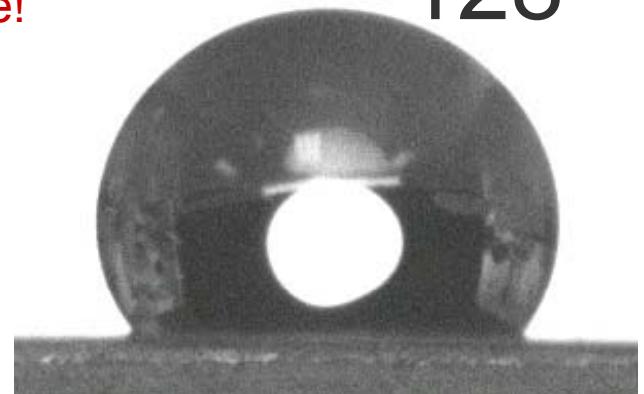

Polychlorotrifluoroethylene  
(PCTFE)

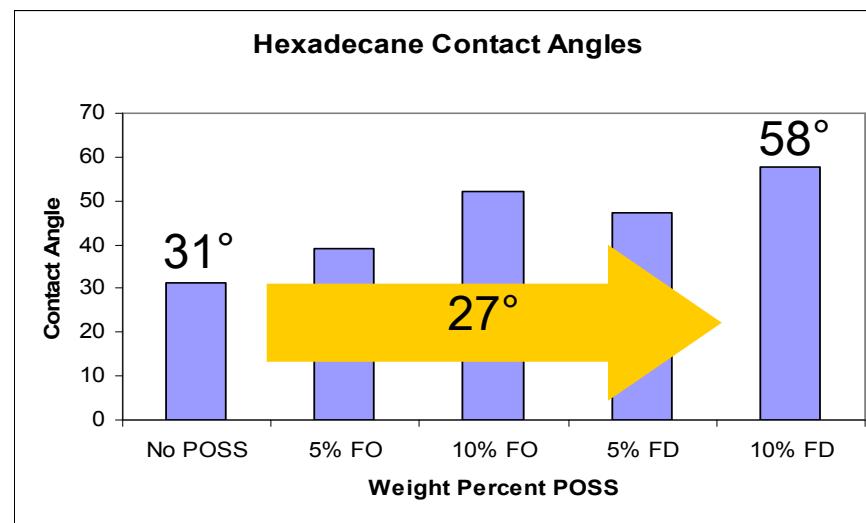

40° increase in water contact angle!

10% POSS

128°

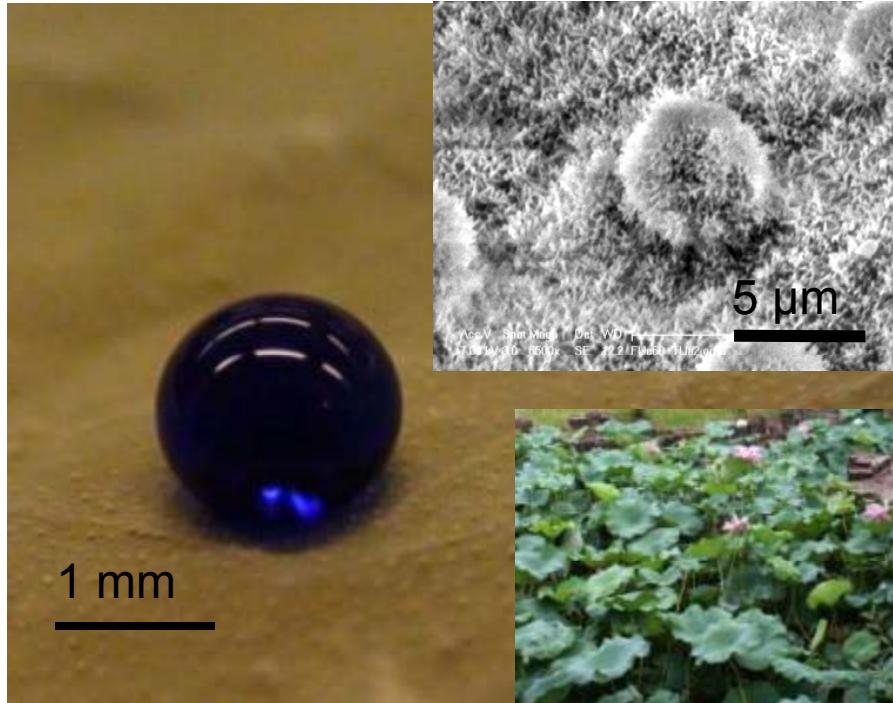

PCTFE with  
10% Fluorodecyl<sub>8</sub>T<sub>8</sub>

Increase in hexadecane contact angle less than desired

# The Lotus Leaf

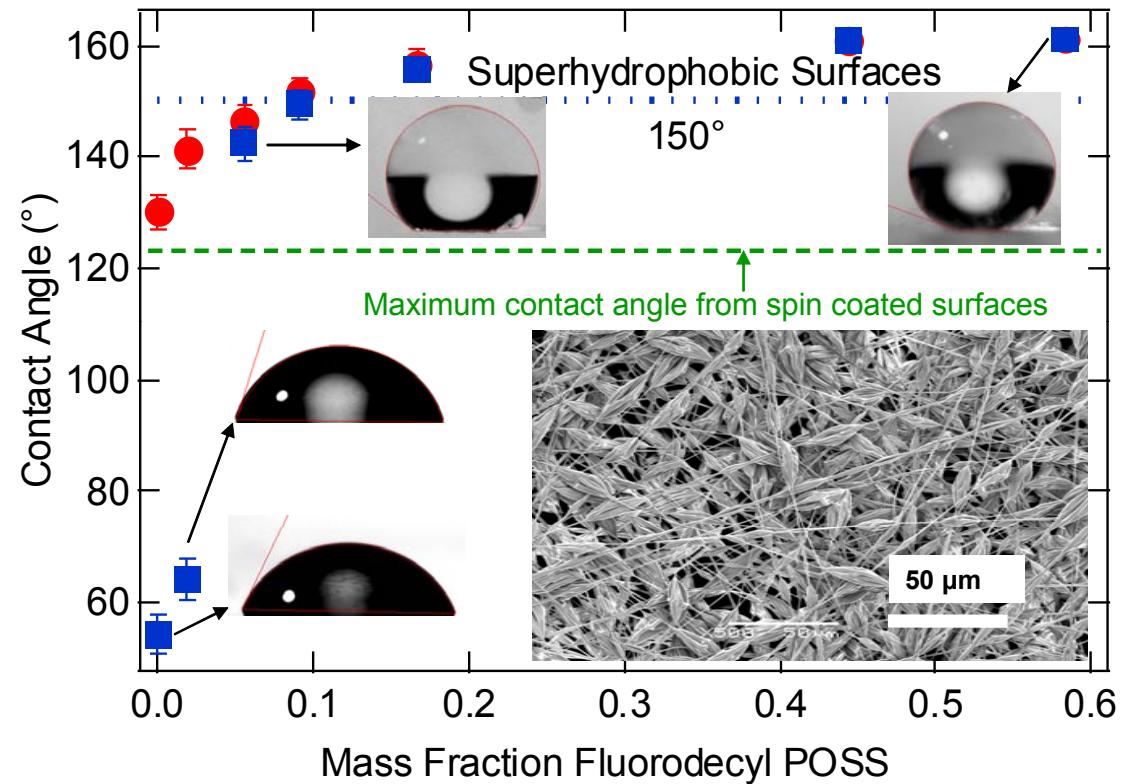

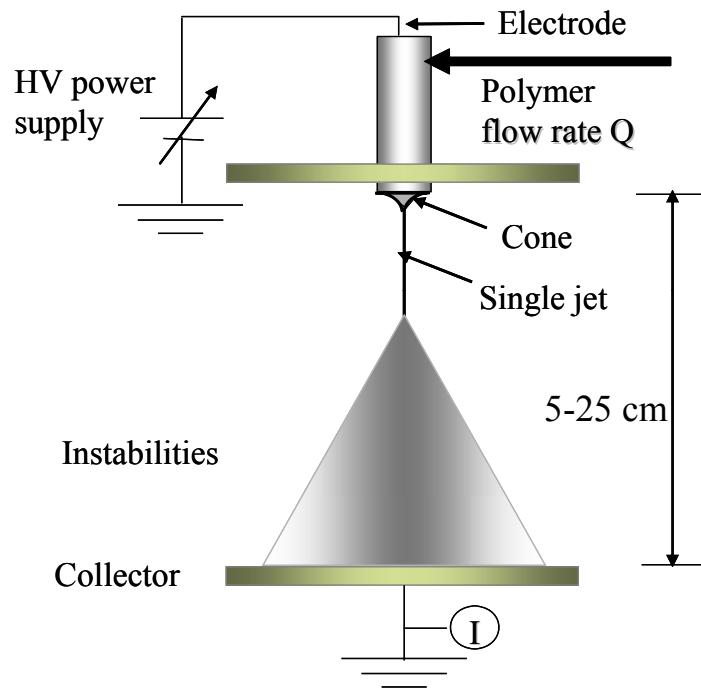

Water,  $\gamma_{LV} = 72.1 \text{ mN/m}$

Hexadecane,  $\gamma_{LV} = 27.5 \text{ mN/m}$

On most surfaces,  $\theta_{oil} < \theta_{water}$ . This is because the surface tension ( $\gamma_{LV}$ ) of water is significantly higher than that for oils.

# Electrospun Surfaces

- ‘Beads on a string’ morphology, with high roughness and porosity
- A single step process - surface turns superhydrophobic for all POSS concentrations > 10 wt%

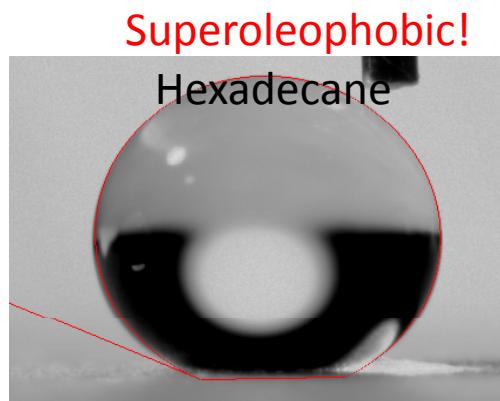

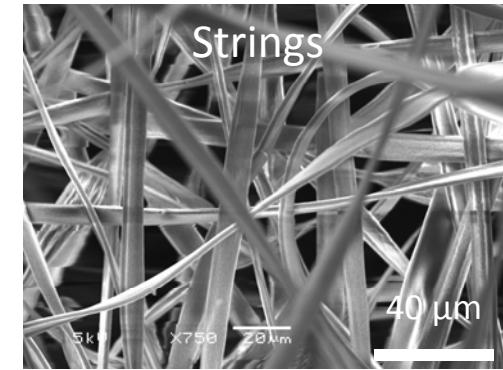

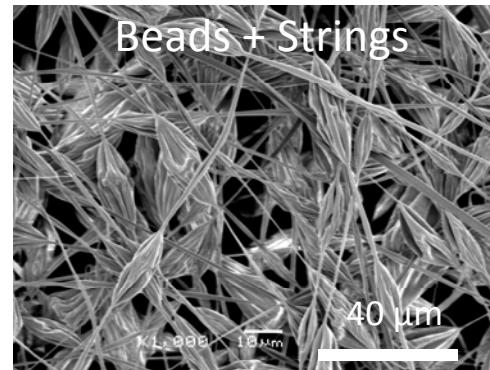

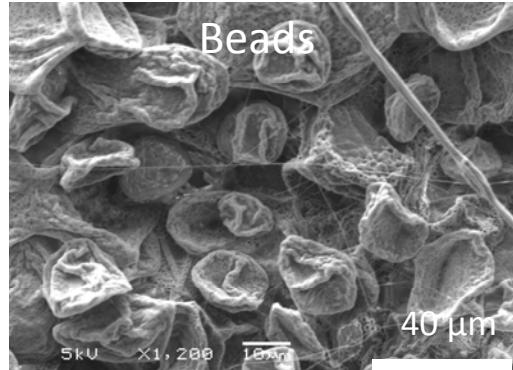

*Science* (2007)

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Effect of Surface Texture

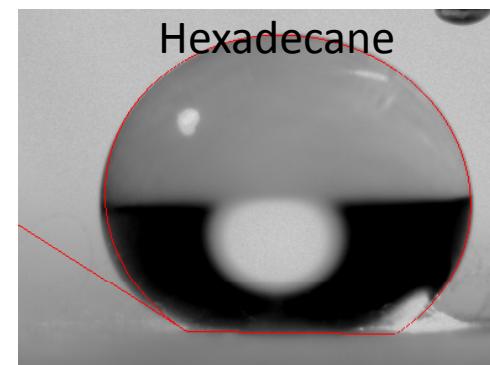

Each surface is composed of PMMA+POSS – 44 wt% blend; contact angle for hexadecane on corresponding spincoated surfaces =  $q_{adv} = q_{rec} = 79^\circ$ .

$$q^*_{adv} = 156^\circ$$

$$q^*_{rec} = 150^\circ$$

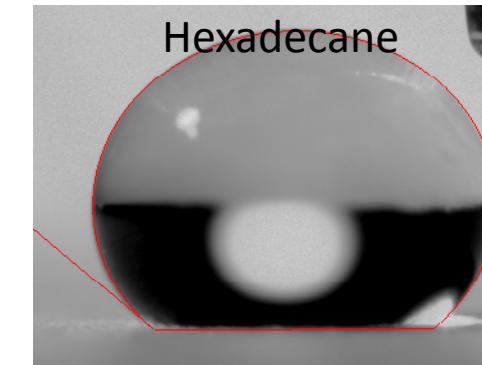

Water contact angles  
 $q^*_{adv} = q^*_{rec} = 165^\circ$

$$q^*_{adv} = 153^\circ$$

$$q^*_{rec} = 141^\circ$$

$q^*_{adv} = q^*_{rec} = 163^\circ$   
Science (2007), PNAS (2008).

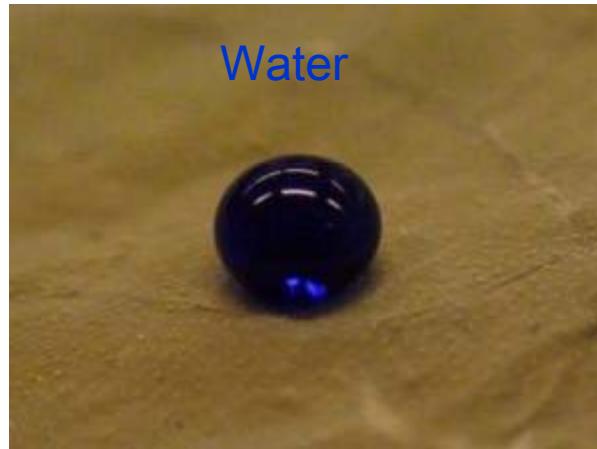

$$q^*_{adv} = 147^\circ$$

$$q^*_{rec} = 120^\circ$$

$$q^*_{adv} = q^*_{rec} = 162^\circ$$

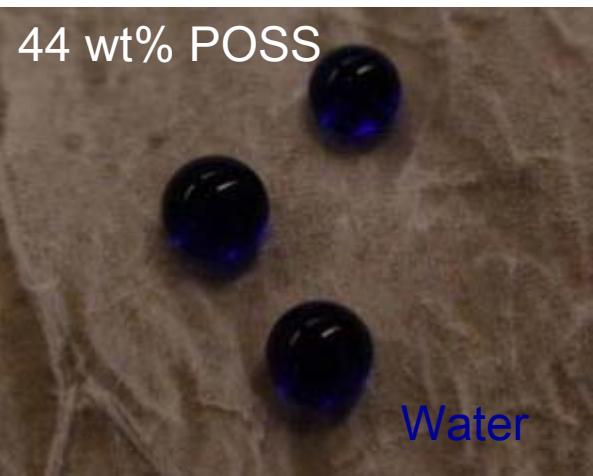

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Comparison with Lotus Leaf

Water

Coat with electrospun fibers

44 wt% POSS

Water

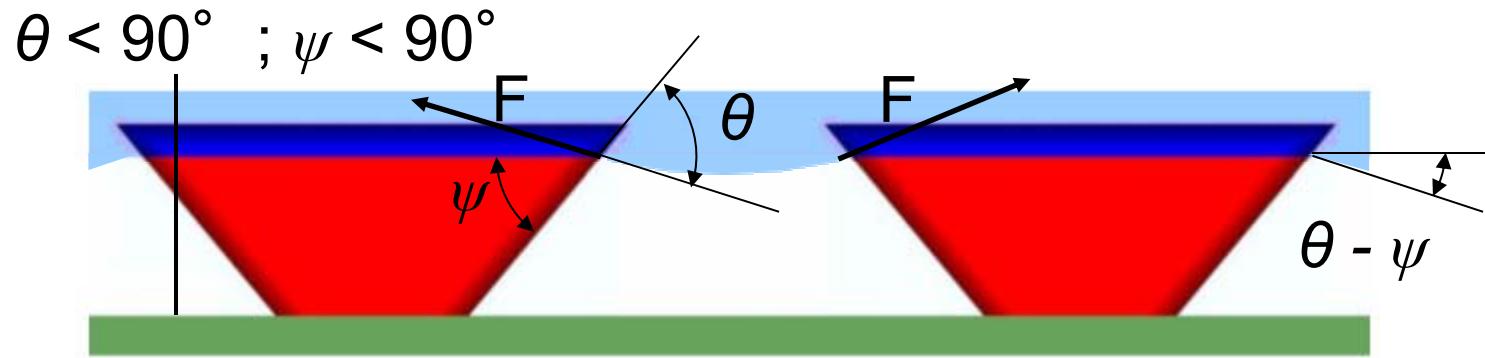

Hexadecane

Coat with electrospun fibers

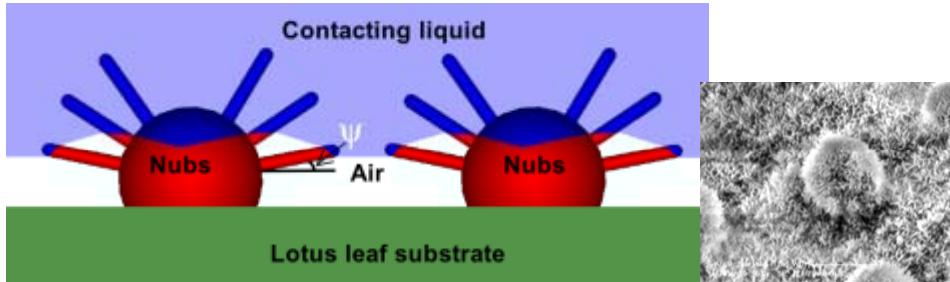

44 wt% POSS

Hexadecane

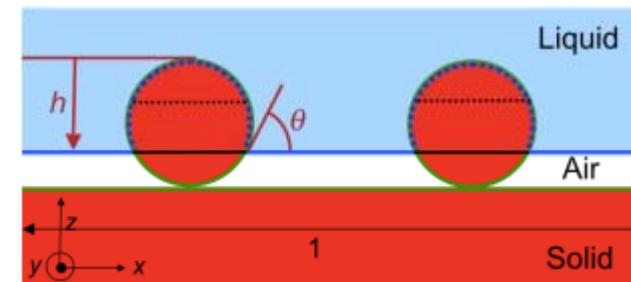

It is possible to support a composite interface even if  $\theta < 90^\circ$

Re-entrant curvature :  $180^\circ > \theta > 0^\circ$

Lotus Leaf

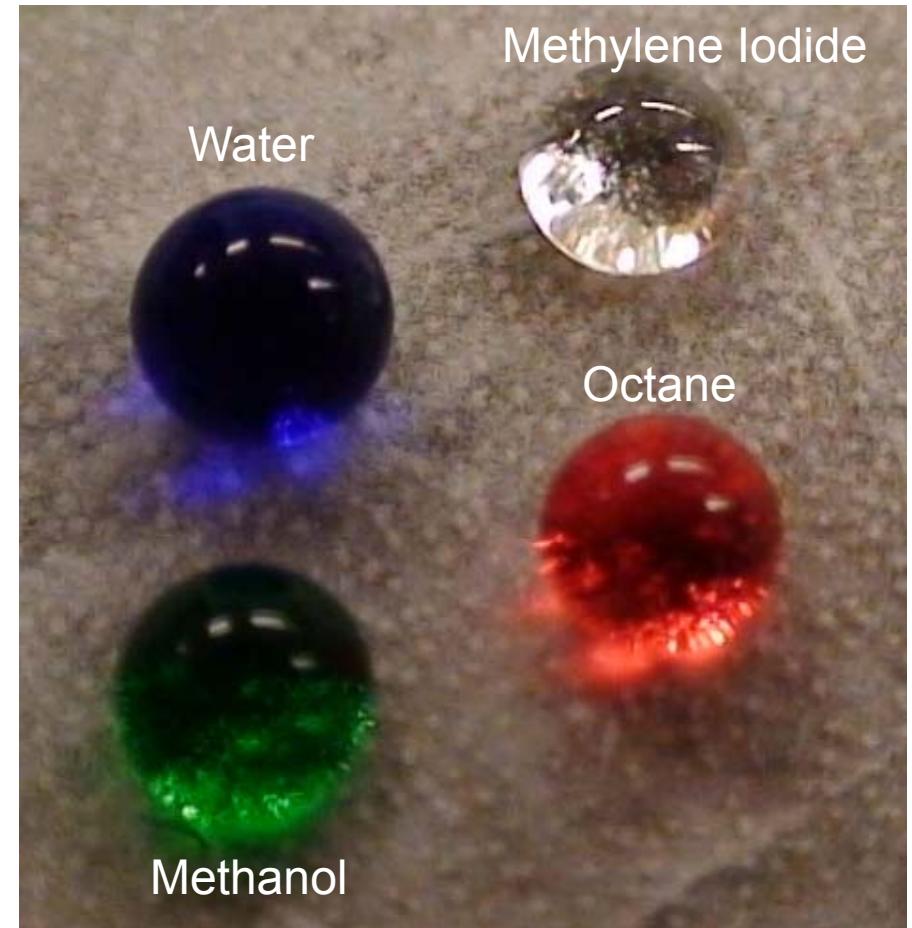

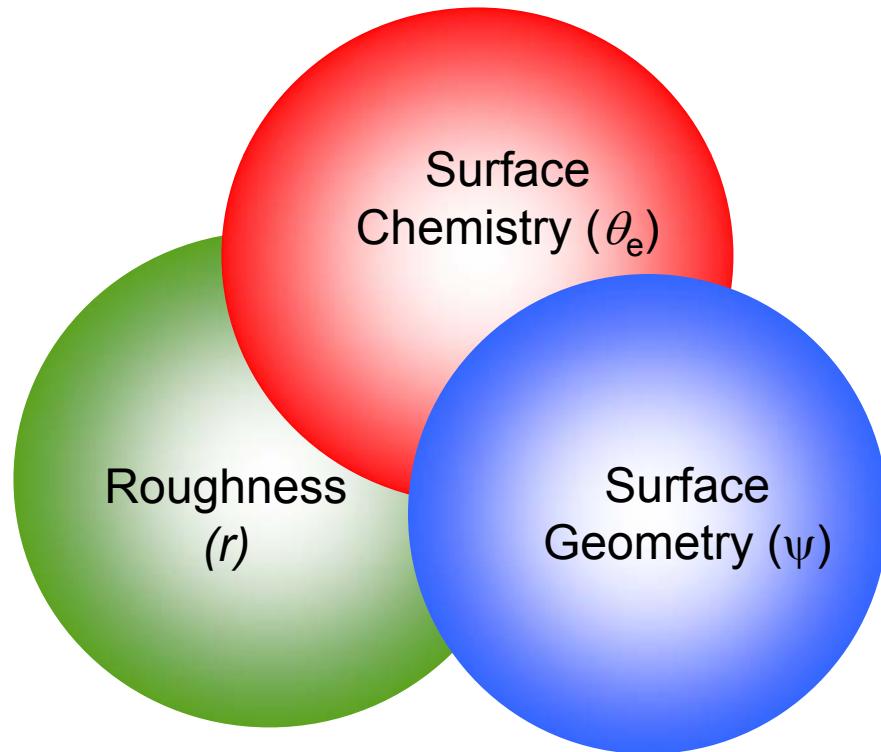

Cylinders / Fibers

Herminghaus, *Euro. Phys. Lett.* (2000), *Science* (2007); PNAS (2008)

DISTRIBUTION A. Approved for public release; distribution unlimited.

- Constructing super-repellent surfaces
  - Three key ingredients

PMMA + 44 wt% POSS  
electrospun coating (beads on a string) morphology

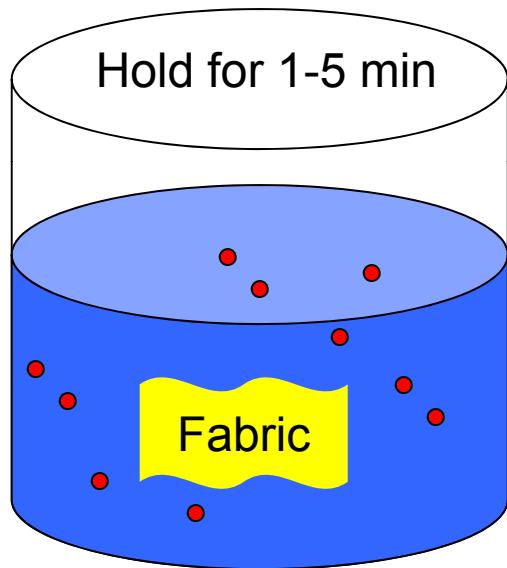

*Science* (2007)

DISTRIBUTION A. Approved for public release; distribution unlimited.

# The Dip-Coating Process

Hexadecane ( $\gamma_V = 27.5 \text{ mN/m}$ ) on an as-received commercial polyester fabric

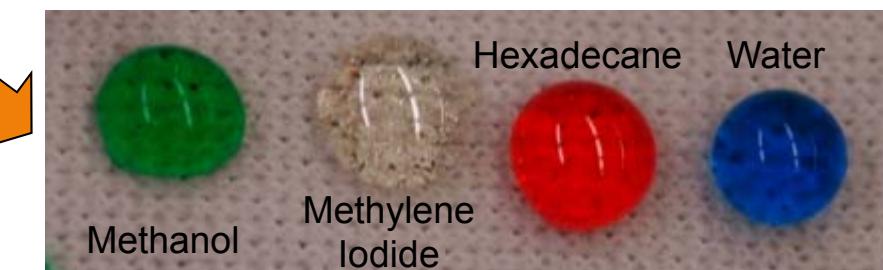

Dip

Before

Dry (heat in oven at 60° C for 20 minutes)

After dip-coating with a solution of  
fluorodecyl POSS

Solution of fluorodecyl POSS in  
Asahiklin (30 mg/ml)

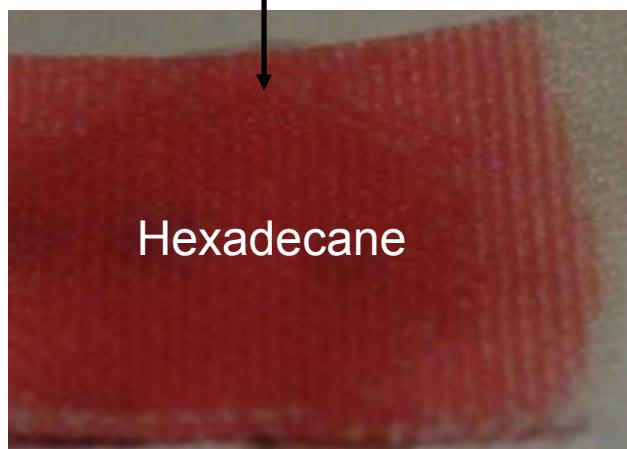

*Adv Mater (2008)*

*DISTRIBUTION A. Approved for public release; distribution unlimited.*

# Dip-Coated Polyester Fabric

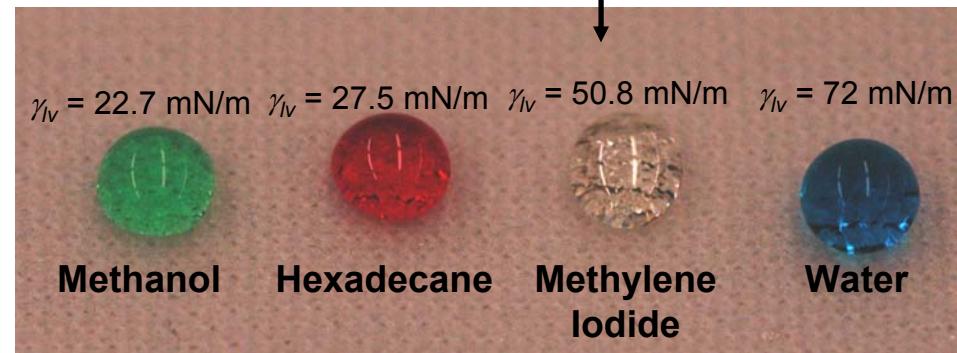

Before coating

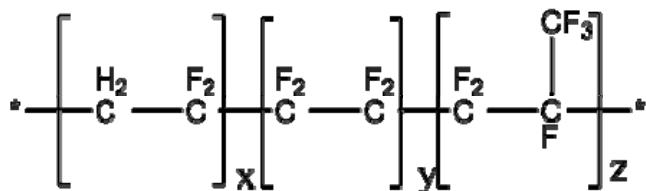

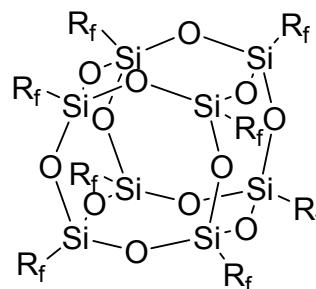

Hexadecane

After coating with fluorodecyl POSS in Asahiklin (30 mg/ml)

# Dip-coating process for conformal coating of textured surfaces

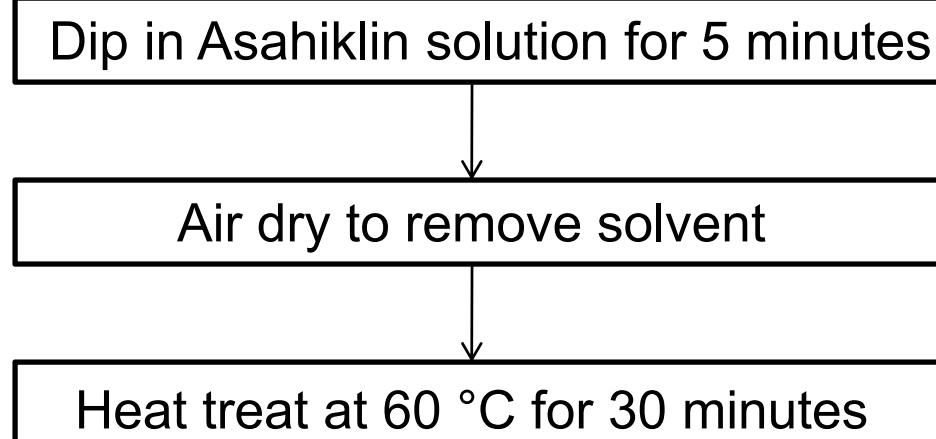

$\text{R}_f = -\text{CH}_2-\text{CH}_2-(\text{CF}_2)_7-\text{CF}_3$   
Fluorodecyl POSS

$\gamma_{sv} \approx 8 \text{ mN/m}$

Tecnoflon® (BR9151)  
Fluoro-elastomer from  
Solvay-Solexis  
 $\gamma_{sv} \approx 18 \text{ mN/m}$

## Designing Superoleophobic Surfaces

Anish Tuteja,<sup>1</sup> Wooseok Choi,<sup>2</sup> Minglin Ma,<sup>2</sup> Joseph M. Nagy,<sup>3</sup> Sarah A. Mazzella,<sup>3</sup> Gregory C. Rutledge,<sup>1</sup> Gareth H. McKinley,<sup>2\*</sup> Robert E. Cohen,<sup>3\*</sup>

**Superhydrophobic  
Superoleophilic**

At low POSS concentrations many surfaces are *both* superhydrophobic and superoleophilic ( $\theta_{\text{alkane}}^* \approx 0^\circ$ ). Thus, these porous surfaces form ideal membranes for separating mixtures / dispersions of alkanes (oils) and water

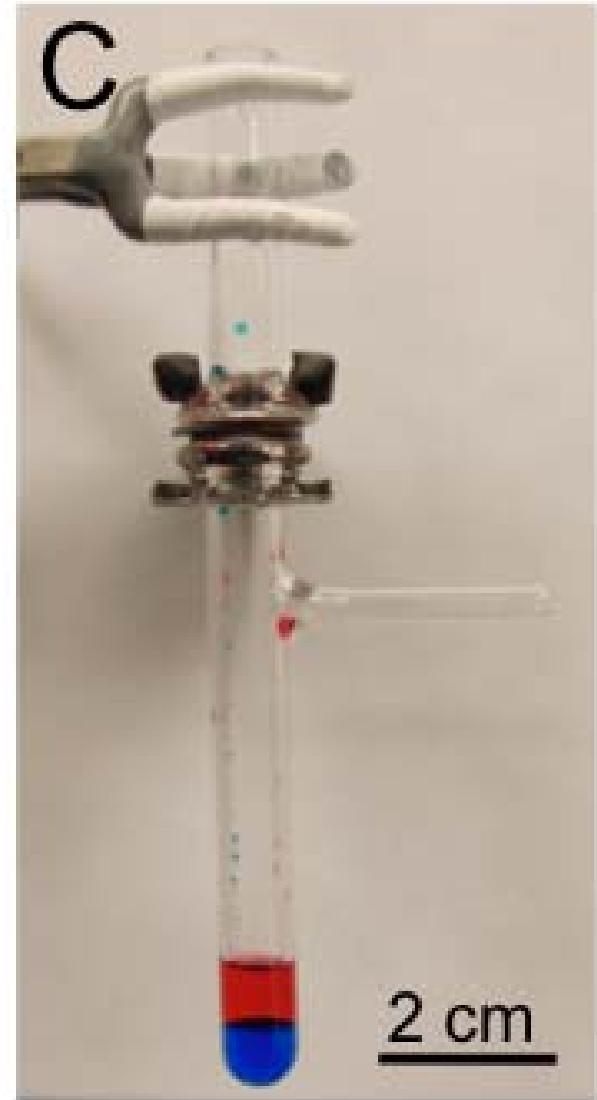

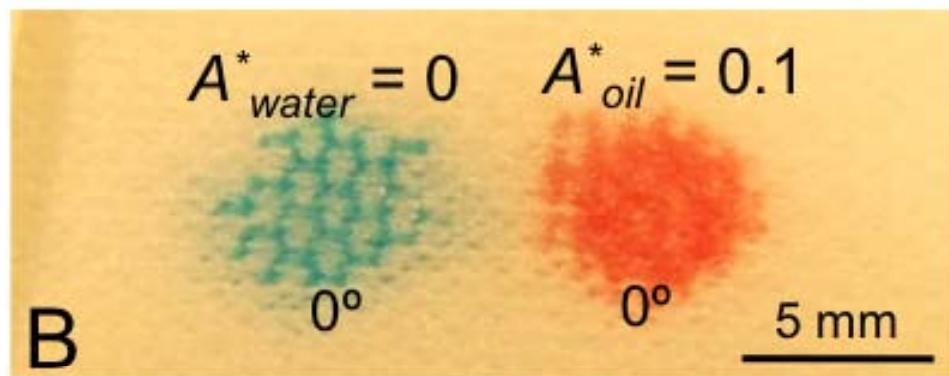

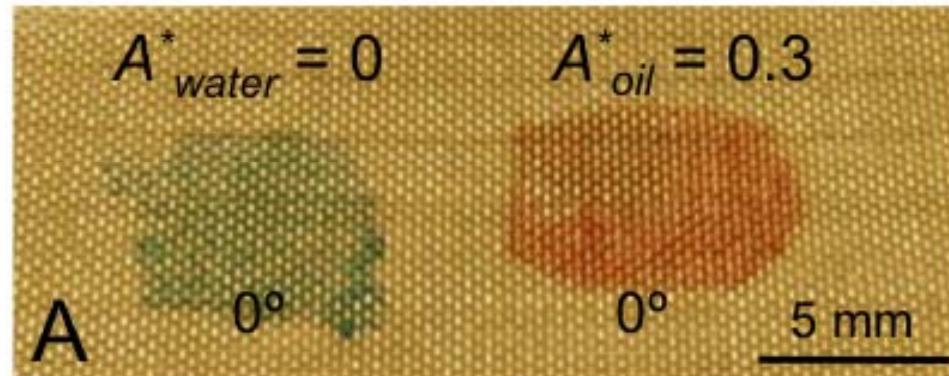

**But...water is more dense than hydrocarbons!**

*Science* (2007)

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Hydrophilic Membranes

**A** and **B**. Neat x-PEGDA dip-coated stainless steel mesh 100 and polyester fabric **C**. An apparatus with a mesh 100 coated with neat x-PEGDA Both water and rapeseed oil permeate through.

*Manuscript in preparation*

DISTRIBUTION A. Approved for public release; distribution unlimited.

# PEGDA + Fluorodecyl POSS

Can hydrogen bond with water

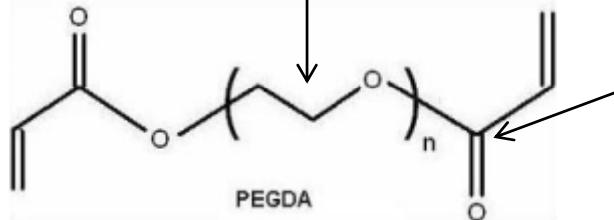

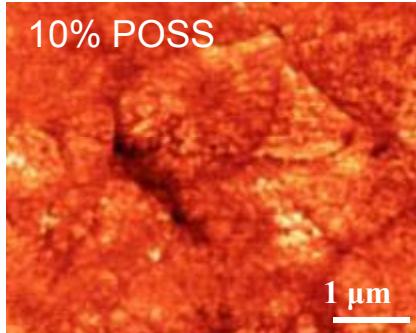

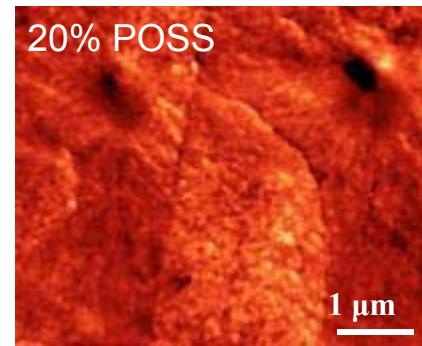

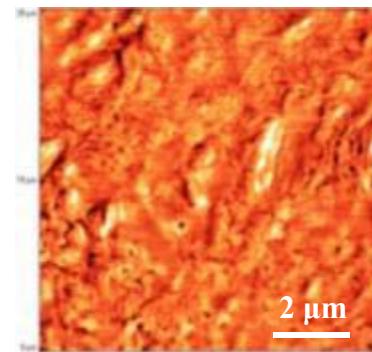

Photo-crosslinkable

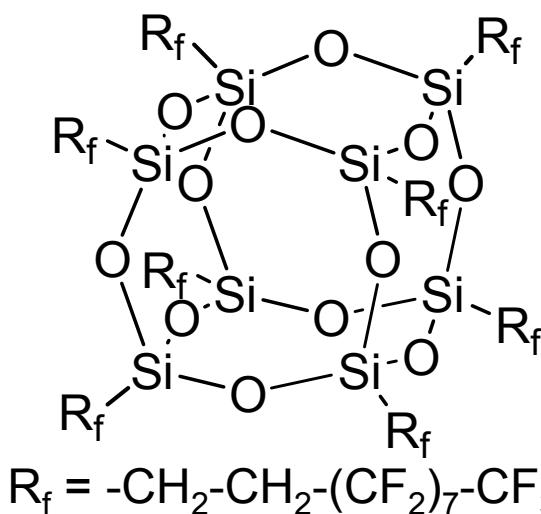

AFM Phase images of spin-coated  
PEGDA + POSS films

20% POSS  
Under water

Fluorodecyl POSS molecules preferentially segregate to the air interface and crystallize.

Fluorodecyl POSS

$$\gamma_{sv} \approx 8 \text{ mN/m}$$

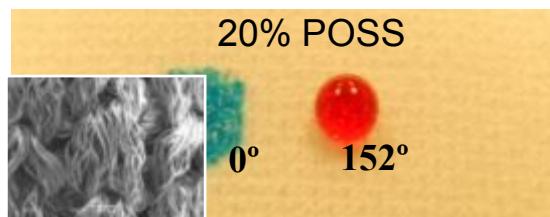

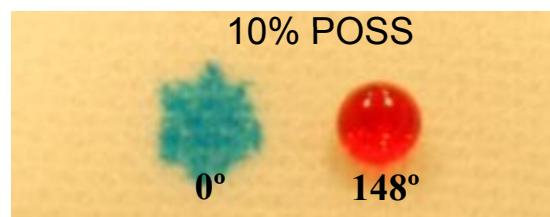

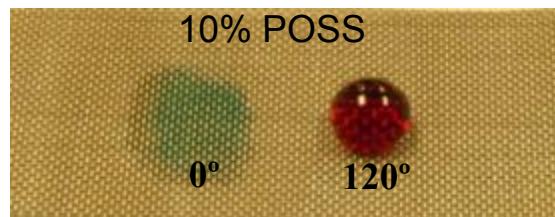

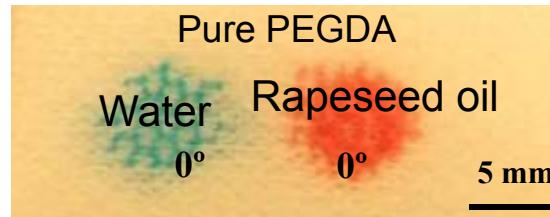

DISTRIBUTION A. Approved for public release; distribution unlimited.

# PEGDA + Fluorodecyl POSS Blends

Surfaces with inherent re-entrant curvature **dip-coated** with PEGDA + POSS blends

Stainless Steel Wire Mesh

Commercial Polyester Fabric

PEGDA surface reconfiguration leads to superhydrophilic behavior.

*Manuscript in preparation*

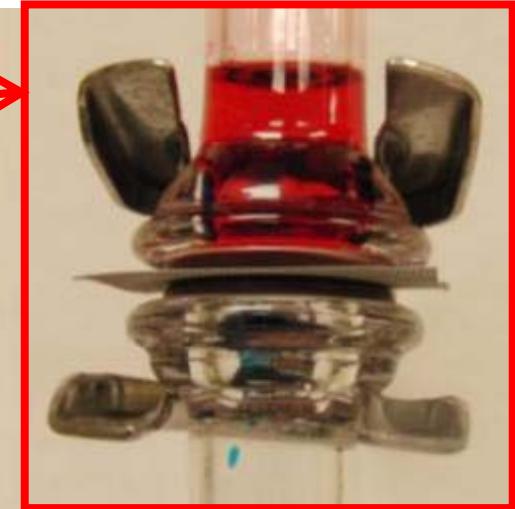

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Free Oil – Water separation

Stainless steel mesh coated with PEGDA + 20 wt% fluorodecyl POSS.

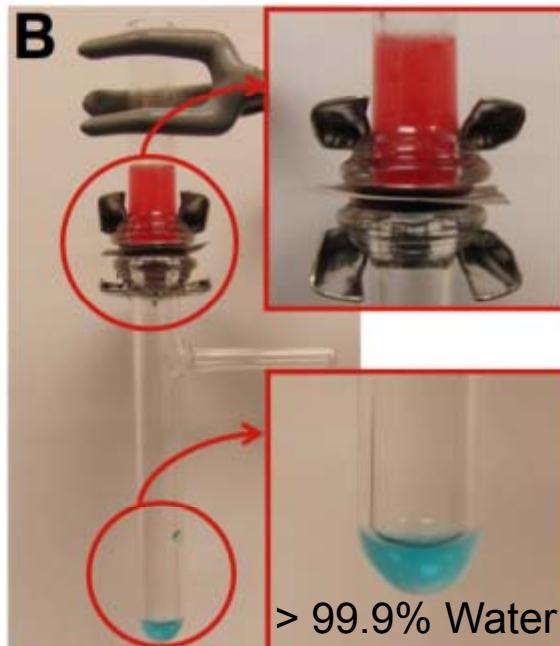

DISTRIBUTION A. Approved for public release; distribution unlimited.

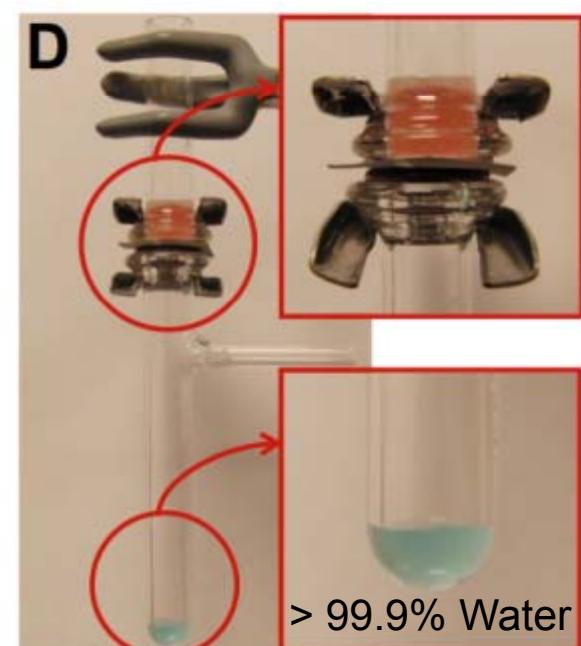

# Separation of Oil-Water Emulsions

Water-in-Oil Emulsion

Oil-in-Water Emulsion

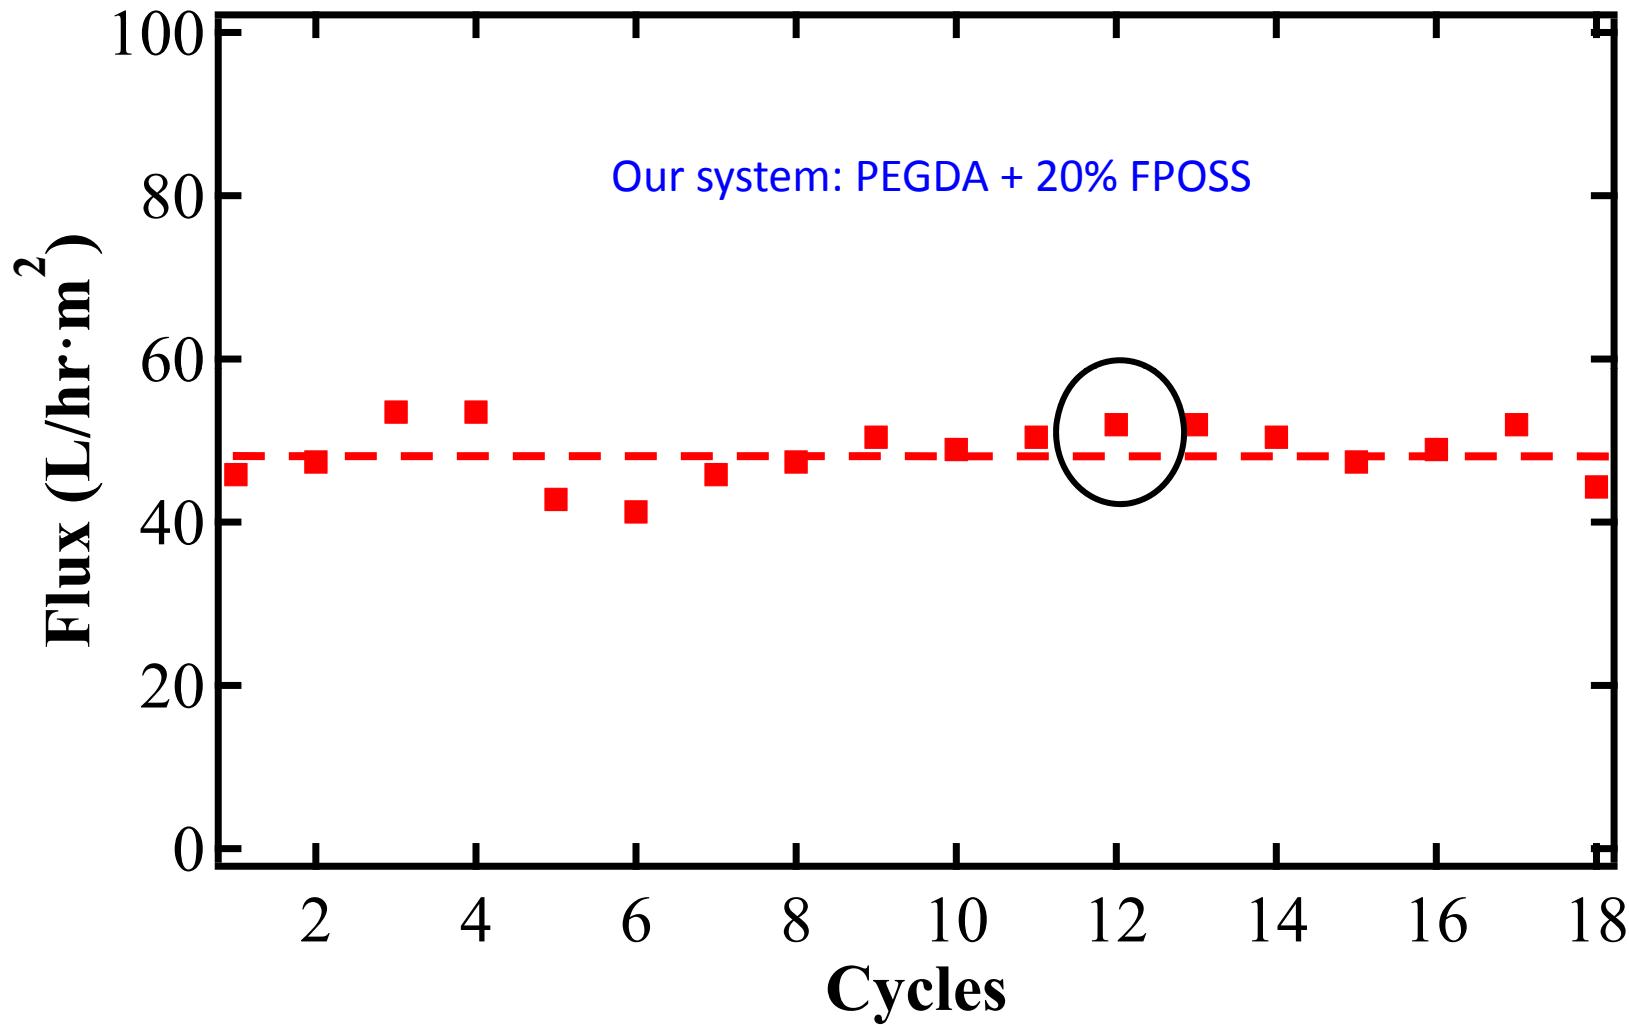

A simple, scalable, gravity-based system for the separation of both oil-in-water and water-in-oil emulsions. This is one of the first gravity-based systems to achieve such high emulsion separation efficiencies.

*Manuscript in preparation*

*DISTRIBUTION A. Approved for public release; distribution unlimited.*

# Oil-Water Emulsion Separation

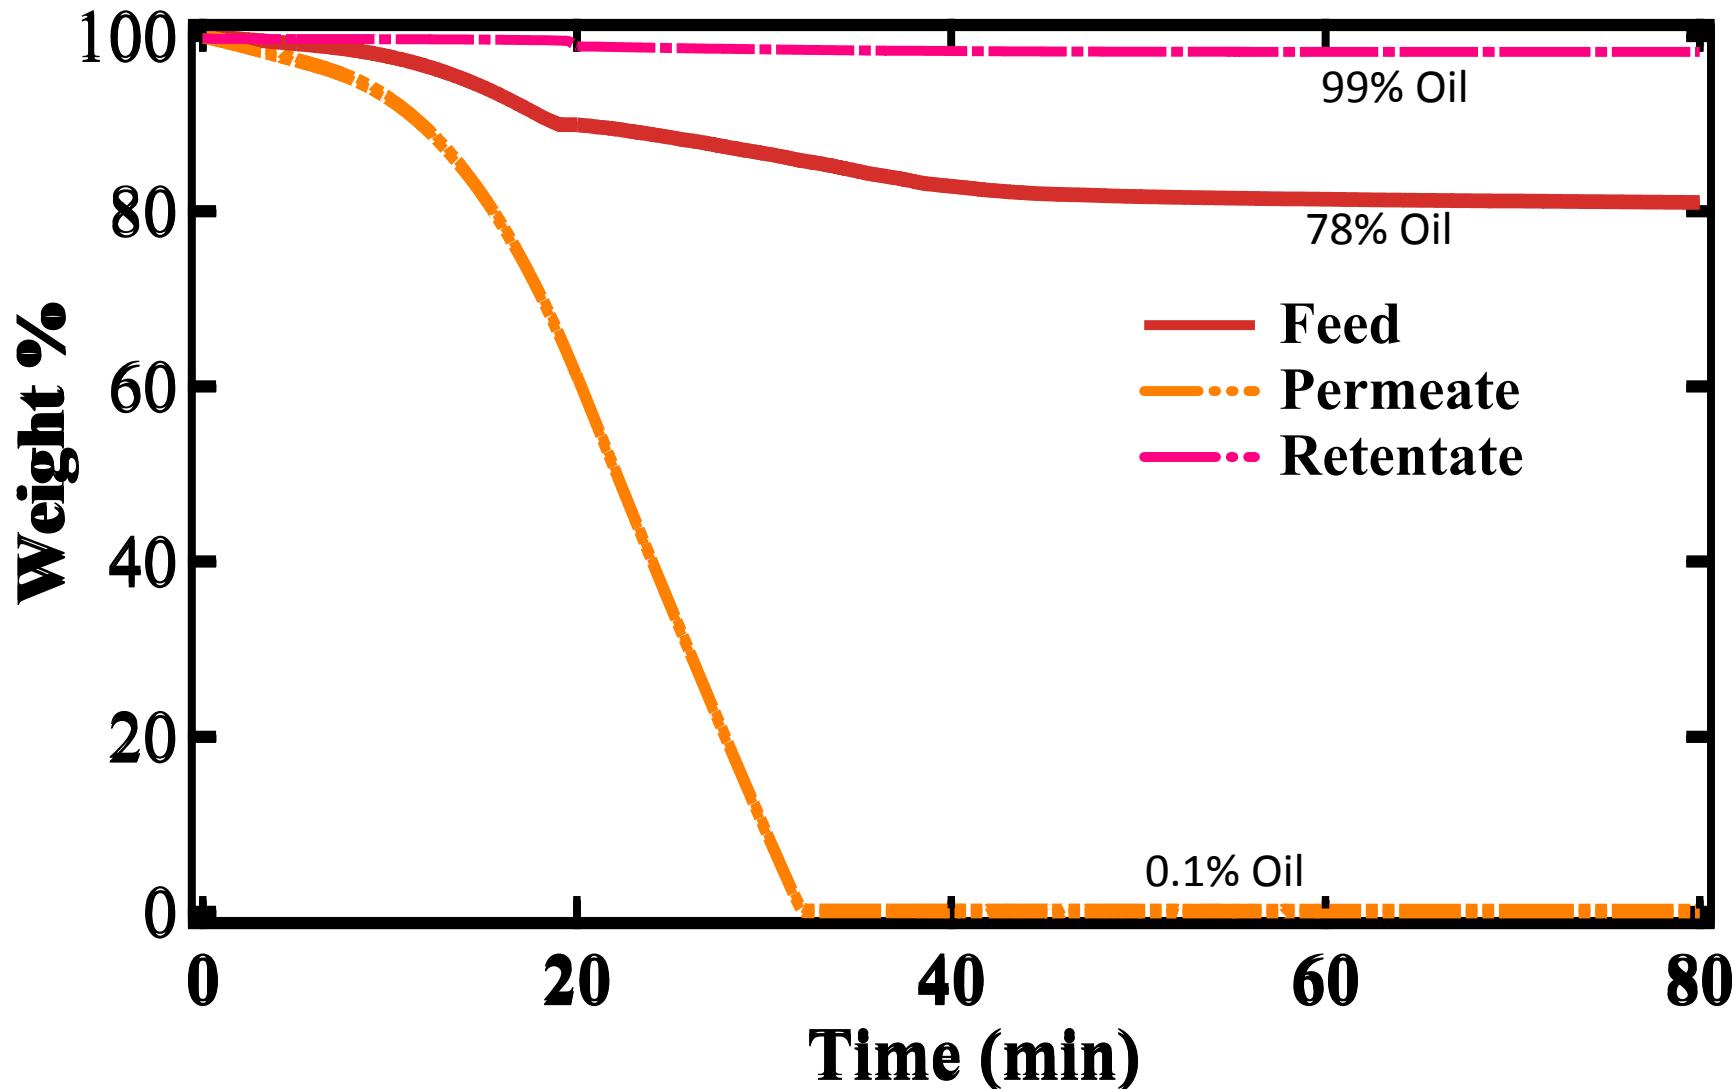

*Manuscript in preparation*

DISTRIBUTION A. Approved for public release; distribution unlimited.

# Separation Efficiency

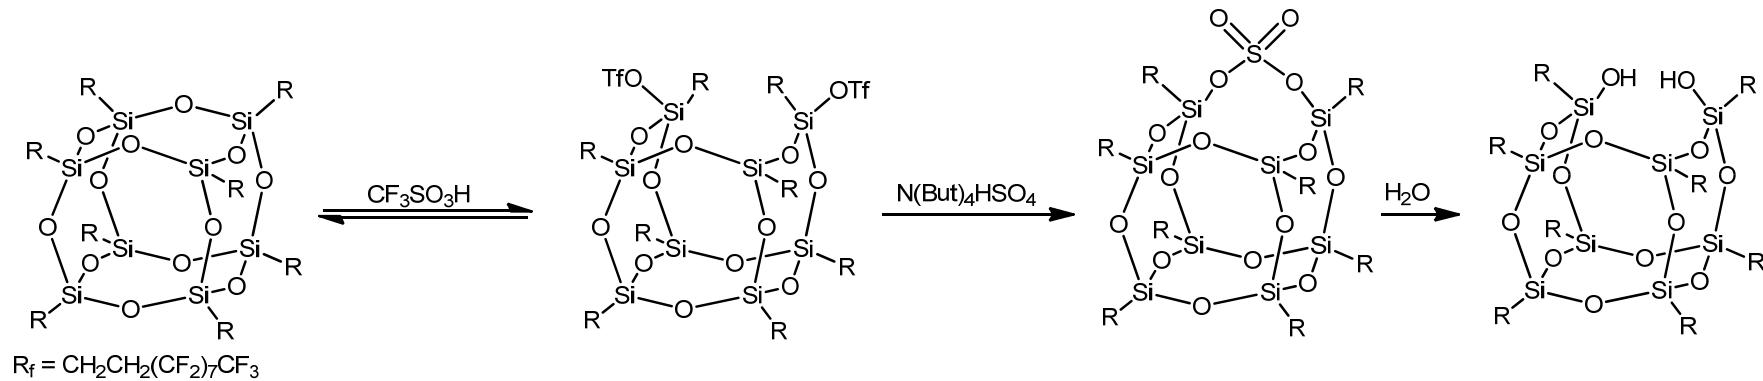

*Manuscript in preparation*
